Status	Finished
Started	Thursday, 29 October 2026, 10:27 PM
Completed	Thursday, 29 October 2026, 10:30 PM
Duration	3 mins 32 secs
Grade	**10.00** out of 10.00 (**100**%)

Question 1

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Develop a Python program to read a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to read.
2. **Output:**
   - The content of the specified line.

input1.txt:

Line one.
Line two.
Line three.
Line four.

For example:

Input	Result
input1.txt 3	Line three.

Answer:(penalty regime: 0 %)

```
filename = input()
line_number = int(input())

with open(filename, "r") as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    print(lines[line_number - 1].strip())
```

```
filename = input()
line_number = int(input())
```

```
3
4  with open(filename, "r") as file:
5      lines = file.readlines()
6
7  if 1 <= line_number <= len(lines):
8      print(lines[line_number - 1].strip())
```

Feedback

Input	Expected	Got
input1.txt 3	Line three.	Line three.
input2.txt 3	Line C.	Line C.

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 2

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Develop a Python program to read a text file and count the total number of words in the file.

Description:

1. **Input:**
   - A text file containing several lines of text.
   - File name you should get as input.
2. **Output:**
   - The total number of words in the file.

For example:

Input	Result
input2.txt	Total words: 14
input3.txt	Total words: 15

Answer:(penalty regime: 0 %)

```
1  filename = input()
2
3  with open(filename, "r") as file:
```

```
    text = file.read()
    words = text.split()

print("Total words:", len(words))
```

```
filename = input()

with open(filename, "r") as file:
    text = file.read()
    words = text.split()

print("Total words:", len(words))
```

Feedback

Input	Expected	Got
input1.txt	Total words: 6	Total words: 6
input2.txt	Total words: 14	Total words: 14
input3.txt	Total words: 15	Total words: 15

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 3

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Create a Python program to delete a specific line from a text file based on a given line number.

Description:

1. **Input:**
    - A text file with multiple lines.
    - A line number to delete.
2. **Output:**
    - The updated file with the specified line removed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`2`
		`Line one.`
		`Line three.`
		`Line four.`

Answer:(penalty regime: 0 %)

```
filename = input()
line_number = int(input())

with open(filename, "r") as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    del lines[line_number - 1]

with open("output.txt", "w") as file:
    file.writelines(lines)
```

```
filename = input()
line_number = int(input())

with open(filename, "r") as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    del lines[line_number - 1]

with open("output.txt", "w") as file:
    file.writelines(lines)
```

Feedback

Test	Input	Expected	Got

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	2
		Line one.
		Line three.
		Line four.
			Line one.
			Line three.
			Line four.

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input2.txt
	3
		Line A.
		Line B.
			Line A.
			Line B.

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 4

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Create a Python program to find the longest word in a text file.

- **Input:**
  - A text file containing multiple lines of text.
- **Output:**
  - The longest word in the file.

For example:

Input	Result
input1.txt	Longest word: containing

Answer:(penalty regime: 0 %)

```
filename = input()

with open(filename, "r") as file:
    text = file.read()

words = text.split()
longest = max(words, key=len)

print("Longest word:", longest)
```

```
filename = input()
```

```
with open(filename, 'r') as file:
    text = file.read()

words = text.split()
longest = max(words, key=len)

print("Longest word:", longest)
```

Feedback

Input	Expected	Got
input1.txt	Longest word: containing	Longest word: containing
input2.txt	Longest word: thousand	Longest word: thousand
input3.txt	Longest word: supercalifragilisticexpialidocious	Longest word: supercalifragilisticexpialidocious

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 5

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Create a Python program to write to a specific line in a text file, replacing the existing content of that line.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to write to.
   - New content for the specified line.
2. **Output:**
   - The updated file with the specified line replaced by the new content in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

Updated line two.

Output:

Line one.
Updated line two.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	2
	Updated line two.
		Line one.
		Updated line two.
		Line three.
		Line four.

Answer:(penalty regime: 0 %)

```
filename = input()
line_number = int(input())
new_content = input()

with open(filename, "r") as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    lines[line_number - 1] = new_content + "\n"

with open("output.txt", "w") as file:
    file.writelines(lines)
```

```
filename = input()
line_number = int(input())
new_content = input()

with open(filename, "r") as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    lines[line_number - 1] = new_content + "\n"

with open("output.txt", "w") as file:
    file.writelines(lines)
```

Feedback

Test	Input	Expected	Got

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	2
	Updated line two.
		Line one.
		Updated line two.
		Line three.
		Line four.
			Line one.
			Updated line two.
			Line three.
			Line four.

Test	Input	Expected	Got

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input2.txt
	2
	Line B Updated.
		Line A.
		Line B Updated.
		Line C.
			Line A.
			Line B Updated.
			Line C.

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 6

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Write a Python program to append a new line at a specific position in a text file, shifting existing lines down.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to insert the new line at.
   - New content for the new line.
2. **Output:**
   - The updated file with the new line inserted at the specified position, shifting the existing lines down in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

  Inserted line..

Output:

Line one.
Line two.
Inserted line.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	3
	Inserted line.
		Line one.
		Line two.
		Inserted line.
		Line three.
		Line four.

Answer:(penalty regime: 0 %)

```
filename = input()
line_number = int(input())
new_content = input()

with open(filename, "r") as file:
    lines = file.readlines()

if lines and not lines[-1].endswith("\n"):
    lines[-1] += "\n"
```

```
    lines[-1] += "\n"

lines.insert(line_number - 1, new_content + "\n")

with open("output.txt", "w") as file:
    file.writelines(lines)
```

```
filename = input()
line_number = int(input())
new_content = input()

with open(filename, "r") as file:
    lines = file.readlines()

if lines and not lines[-1].endswith("\n"):
    lines[-1] += "\n"

lines.insert(line_number - 1, new_content + "\n")

with open("output.txt", "w") as file:
    file.writelines(lines)
```

Feedback

Test	Input	Expected	Got

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	3
	Inserted line.
		Line one.
		Line two.
		Inserted line.
		Line three.
		Line four.
			Line one.
			Line two.
			Inserted line.
			Line three.
			Line four.

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input2.txt
	4
	Inserted line D.
		Line A.
		Line B.
		Line C.
		Inserted line D.
			Line A.
			Line B.
			Line C.
			Inserted line D.

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 7

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Write a Python program to count the frequency of each word in a given text file.

Description:

1. **Input:**
    - String as input.

2. **Output:**
    - A list of words with their corresponding frequency count to be write in a file "output.txt"

Example:

- **Input File Content:**

  apple orange apple banana apple orange

Output:

apple: 3
orange: 2
banana: 1

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	apple orange apple banana apple orange	apple: 3
		banana: 1
		orange: 2

Answer:(penalty regime: 0 %)

```
from collections import Counter
import re

text = input().lower()
words = re.findall(r'\b\w+\b', text)
freq = Counter(words)

with open("output.txt", "w") as file:
    for word in sorted(freq):
        file.write(f"{word}: {freq[word]}\n")
```

```
from collections import Counter
import re

text = input().lower()
words = re.findall(r'\b\w+\b', text)
freq = Counter(words)

with open("output.txt", "w") as file:
    for word in sorted(freq):
        file.write(f"{word}: {freq[word]}\n")
```

Feedback

Test	Input	Expected	Got

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	apple orange apple banana apple orange	apple: 3
		banana: 1
		orange: 2
			apple: 3
			banana: 1
			orange: 2

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	Hello world! Hello everyone. Welcome to the world of programming.	everyone: 1
		hello: 2
		of: 1
		programming: 1
		the: 1
		to: 1
		welcome: 1
		world: 2
			everyone: 1
			hello: 2
			of: 1
			programming: 1
			the: 1
			to: 1
			welcome: 1
			world: 2

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	One fish two fish Red fish blue fish	blue: 1
		fish: 4
		one: 1
		red: 1
		two: 1
			blue: 1
			fish: 4
			one: 1
			red: 1
			two: 1

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 8

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Develop a Python program to identify and print all palindrome words from a given text file.

Description:

1. **Input:**
   - A text file containing multiple words.
2. **Output:**
   - A list of palindrome words found in the file name as 'output.txt'.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt	madam
		arora
		malayalam

Answer:(penalty regime: 0 %)

```
import re

filename = input()

with open(filename, "r") as file:
    text = file.read()

words = re.findall(r'\b[a-zA-Z]+\b', text)

with open("output.txt", "w") as file:
    for word in words:
        if len(word) > 1 and word.lower() == word.lower()[::-1]:
            file.write(word.lower() + "\n")
```

```python
import re

filename = input()

with open(filename, "r") as file:
    text = file.read()

words = re.findall(r'\b[a-zA-Z]+\b', text)

with open("output.txt", "w") as file:
    for word in words:
        if len(word) > 1 and word.lower() == word.lower()[::-1]:
            file.write(word.lower() + "\n")
```

Feedback

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt	madam
		arora
		malayalam
			madam
			arora
			malayalam

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 9

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Develop a Python program to copy the contents of one file to another file.

Description:

1. **Input:**
   - Source file and destination file names.
2. **Output:**
   - The content of the source file copied to the destination file.

For example:

Test	Input	Result

`with open('output1.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	output1.txt
		This is the source file.
		It contains multiple lines of text.
		Here is another line.

Answer:(penalty regime: 0 %)

```python
source = input()
destination = input()
```

```
with open(source, "r") as file:
    content = file.read()

with open(destination, "w") as file:
    file.write(content)
```

```
source = input()
destination = input()

with open(source, "r") as file:
    content = file.read()

with open(destination, "w") as file:
    file.write(content)
```

Feedback

Test	Input	Expected	Got

`with open('output1.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`

`with open('output3.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input3.txt`
	`output3.txt`
		`Single line.`	`Single line.`

Passed all tests!

Correct
Marks for this submission: 1.00/1.00.

Question 10

Correct
Mark 1.00 out of 1.00
Flag question

Question text

Write a Python program to reverse the contents of a specific line in a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to reverse.
2. **Output:**
   - The updated file with the specified line's contents reversed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

Output:

Line one.
Line two.
eerht eniL.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	3
		Line one.
		Line two.
		eerht eniL.
		Line four.

Answer:(penalty regime: 0 %)

```
filename = input()
line_number = int(input())

with open(filename, "r") as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    line = lines[line_number - 1].rstrip("\n")

    if line.endswith("."):
        lines[line_number - 1] = line[:-1][::-1] + "." + ("\n" if line_number < len(lines) or lines[line_number - 1]
    else:
        lines[line_number - 1] = line[::-1] + ("\n" if lines[line_number - 1].endswith("\n") else "")

with open("output.txt", "w") as file:
    file.writelines(lines)
```

```
filename = input()

Question 1

Correct
Mark 1.00 out of 1.00
Flag question

Question text

What is the use of seek() method in files?

Question 1 Answer

a.

sets the file’s current position at the offset

b.

none of the mentioned

c.

sets the file’s current position within the file

d.

sets the file’s previous position at the offset

Feedback

The correct answer is:

sets the file’s current position at the offset

Question 2

Correct
Mark 1.00 out of 1.00
Flag question

Question text

What does the following code do?

```
f = open("data.txt", "a")
f.write("Adding new data\n")
f.close()
```

Question 2 Answer

a.

Appends "Adding new data" to the end of the file

b.

Raises an error because the file is opened in append mode

c.

Overwrites the file with "Adding new data"

d.

Opens the file in read mode

Feedback

The correct answer is: Appends "Adding new data" to the end of the file

Question 3

Incorrect
Mark 0.00 out of 1.00
Flag question

Question text

What happens if you try to open a file in read mode ('r') that does not exist?

Question 3 Answer

a.
A new file is created

b.
The operation is ignored

c.
An error is raised

d.
An empty file object is returned

Feedback

The correct answer is: An error is raised

Question text

Which method is used to close a file in Python?

Question 5 Answer

a.
close()

b.
terminate()

c.
finish()

d.
end()

Feedback

The correct answer is: close()

Question 6

Correct
Mark 1.00 out of 1.00
Flag question

Question text

What is the result of the following code?

```
with open("example.txt", "r") as f:
    data = f.read()
print(data)
```

Question 6 Answer

a.

Prints an error message

b.

Prints the first 10 characters of the file

c.

Prints the entire content of the file

d.

Prints each line of the file

Feedback

The correct answer is: Prints the entire content of the file

Question 7

Correct
Mark 1.00 out of 1.00
Flag question

Question text

What is the purpose of the with statement in Python file handling?

Question 7 Answer

a.
To automatically close the file after its suite finishes

b.
To write data to a file

c.
To delete a file

d.
To read data from a file

Feedback

The correct answer is: To automatically close the file after its suite finishes

Question 8

Correct
